

1. The Challenge before you is to write a formula to clean the data. If you perform any mathematical operation on the data, it will return #VALUE error. You need to clean the data through a formula

formula: `--SUBSTITUTE(SUBSTITUTE(A2,LEFT(A2,1),""),RIGHT(A2,1),"")`

The screenshot shows the Microsoft Excel interface. The formula bar at the top displays the formula: `--SUBSTITUTE(SUBSTITUTE(A2,LEFT(A2,1),""),RIGHT(A2,1),"")`. Below the formula bar, a table of data is visible. The table has two columns, A and B. Column A is labeled 'Data' and contains values: 720, 1834.06, 1063.71, 25000, 10000, 2500, 23950, 10000, 5000, 2910, 25000. Column B contains the same values as column A. The formula in cell B2 is designed to clean the data by removing the first and last characters of each value in column A.

	A	B
1	Data	
2	720	720
3	1834.06	1834.06
4	1063.71	1063.71
5	25000	25000
6	10000	10000
7	10000	10000
8	2500	2500
9	23950	23950
10	10000	10000
11	5000	5000
12	2910	2910
13	25000	25000
